## 1. Introduction

Array Networks' AVX Series network functions platforms host multiple Array, 3rd-party and open-source virtual appliances, providing the agility of cloud and virtualization with the guaranteed performance of dedicated appliances.

Array's AVX Series network functions platform hosts up to 32 fully independent virtual appliances (VAs), including Array load balancing and SSL VPN as well as 3rd-party VAs from leading networking and security vendors. Designed with managed service providers and enterprises in mind, the AVX Series enables data center consolidation without sacrificing the agility of cloud and virtualization or the performance of dedicated appliances. Uniquely capable of assigning dedicated CPU, SSL, memory and interface resources per VA, the AVX Series network functions platform is the only solution to deliver guaranteed performance in shared environments.

The following sections will describe the steps required to deploy an Array Networks vAPV Application Delivery Controller in HA (High Availability) mode on the AVX Series network functions platform.

The Array vAPV is a virtual application delivery controller that improves application availability, performance and security while enabling dynamic, flexible and elastic provisioning in cloud and virtual environments. For the purposes of this deployment guide the vAPV will be deployed on the AVX as a VA instance to provide server load balancing.

## 2. Prerequisites

This deployment guide requires the following hardware and software products.

### 2.1. Array Networks AVX Network Functions Platform

- Two AVX Series (x600 or x800 models) network functions platforms running version ArrayOS 2.7.0.34 or later with valid licenses.

The AVX appliances can be purchased from Array Networks or authorized resellers. For more information on deploying the AVX appliances, please refer to the AVX Web UI Guide, which is accessible through the product's Web User Interface.

### 2.2. Array Networks vAPV Series Application Delivery Controllers

- Two vAPV (small, medium or large instance size) virtual appliances running version ArrayOS 8.6.1.80 or later for server load balancing with valid licenses. One vAPV instance will be deployed on each AVX platform. Ensure the AVX platforms have enough hardware resources to support the vAPV instances.

The vAPV appliances can be purchased from Array Networks or authorized resellers. For more information on deploying the vAPV appliance for AVX, please refer to the APV ArrayOS™ Web UI Guide, which is accessible through the product's Web User Interface.

**Note:** Assuming you have all these components, it should roughly take **120** minutes to complete the entire configuration in this deployment guide.

### 3. Network Topology

Figure 1 shows a detailed configuration of the vAPV HA on AVX deployment.

#### vAPV HA on AVX Network Topology

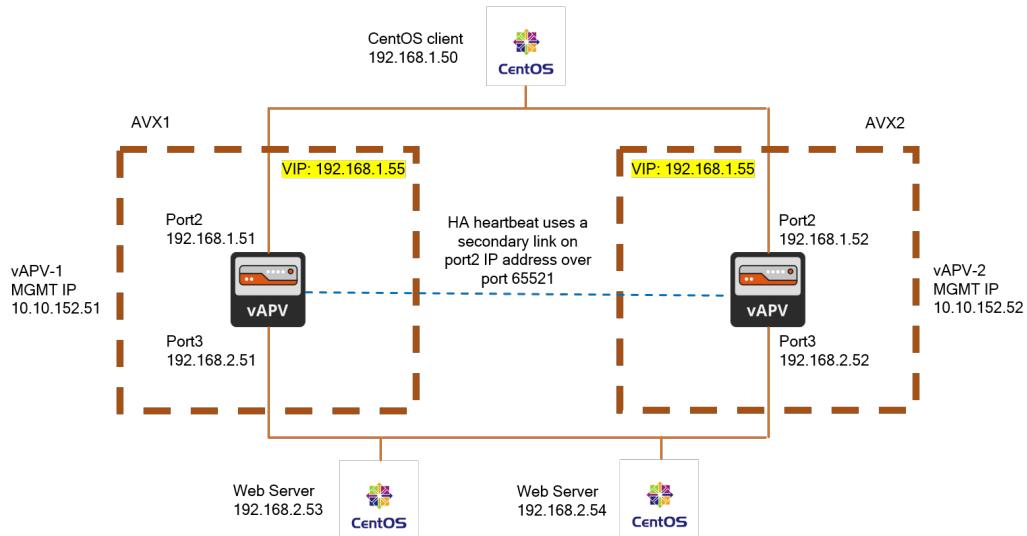

Figure 1 – Deployment Details

In this deployment, there is one vAPV instance running on each of the AVX platforms. The vAPV instances will have identical IP configuration on the ingress (port2) and egress (port3) interfaces. Port2 and port3 are the traffic ports and both use the SR-IOV ports. A secondary link on port2 is required for HA heartbeat packets transmission. The secondary link uses port 65521 on the port2 IP address.

#### Typical Traffic Flow: Inbound

The client machine and the web server are running CentOS, both external to the AVX platform. The two CentOS machines are required only to validate the design.

The client (top) will generate web server (bottom) requests to the CentOS web servers via the active/master vAPV instance. In the event of HA failure and the master/active vAPV instance fails, the standby vAPV instance will take over as the master/active vAPV. If the original master/active vAPV instance becomes active again, it will resume ownership as the master/active instance.

## 4. Configuring AVX1

To configure the first AVX appliance, follow these steps:

1. Login to the AVX console using default credentials.

```
Login: array
```

```
Password: admin
```

2. Type “enable” and hit the <Enter> key (twice) to enter enable mode. No password is required.

```
AN>enable
```

```
Enable password:
```

```
AN#
```

3. Type “config terminal” to enter config mode.

```
AN#config terminal
```

```
AN(config)#
```

4. Change the hostname to AVX1.

```
AN(config)#hostname AVX1
```

```
AVX1(config)#
```

5. Configure the IP address and default gateway for the management port.

```
AVX1(config)#ip address 10.10.152.171 255.255.255.0 (use your own IP)
```

```
AVX1(config)#ip route default 10.10.152.1 (use your own gateway IP)
```

6. Enable WebUI.

```
AVX1(config)#webui on
```

7. Save changes.

```
AVX1(config)#write memory
```

You may now access the AVX1 appliance using the WebUI at <https://<IP>:8888>. In this example, <https://10.10.152.171:8888>.

## 5. Deploying the vAPV VA Instance on AVX1

To deploy the vAPV instance on the AVX appliance, follow these steps:

1. Obtain the image of the vAPV
2. Import the image to the AVX appliance
3. Create a VA instance with the image on the AVX appliance
4. Assign Virtual Traffic ports to the VA instance
5. Start the VA instance

### 5.1. Obtain the Image of the vAPV

By default, the vAPV is already preloaded as a VA image on the AVX. If not, please contact Array Networks to obtain the image. Please consult the AVX Application Guide or AVX CLI Handbook for additional information on how to upload and create a VA instance.

### 5.2. Import the Image to the AVX Appliance

On the AVX WebUI, navigate to **VA Management > VA Image** to upload the vAPV image.

### 5.3. Create a VA Instance with the Image on the AVX Appliance

On the AVX WebUI, navigate to **VA Management > VA** to create the VA instance using the vAPV image.

1. Create a vAPV VA instance named vAPV-1.

Create a VA Instance	
VA Name	vAPV-1
Image	default
VA Size	small
Domain ID	1

Next

2. Configure two traffic ports using the SR-IOV ports. Select the Manual option.

Assign Resources to VA Instance

Auto       Manual

CPU Threads: 1 2 20

Memory: 4G 57G

Unassign Port VFs or SSL VFs

**Port VF Assignment**

Port1 VFs	<input checked="" type="checkbox"/>	<input type="checkbox"/>					
Port2 VFs	<input checked="" type="checkbox"/>	<input type="checkbox"/>					
Port3 VFs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port4 VFs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**SSL VF Assignment**

[Previous](#) [Next](#)

### 3. Confirm the VA Instance Configuration.

Confirm VA Instance Configuration

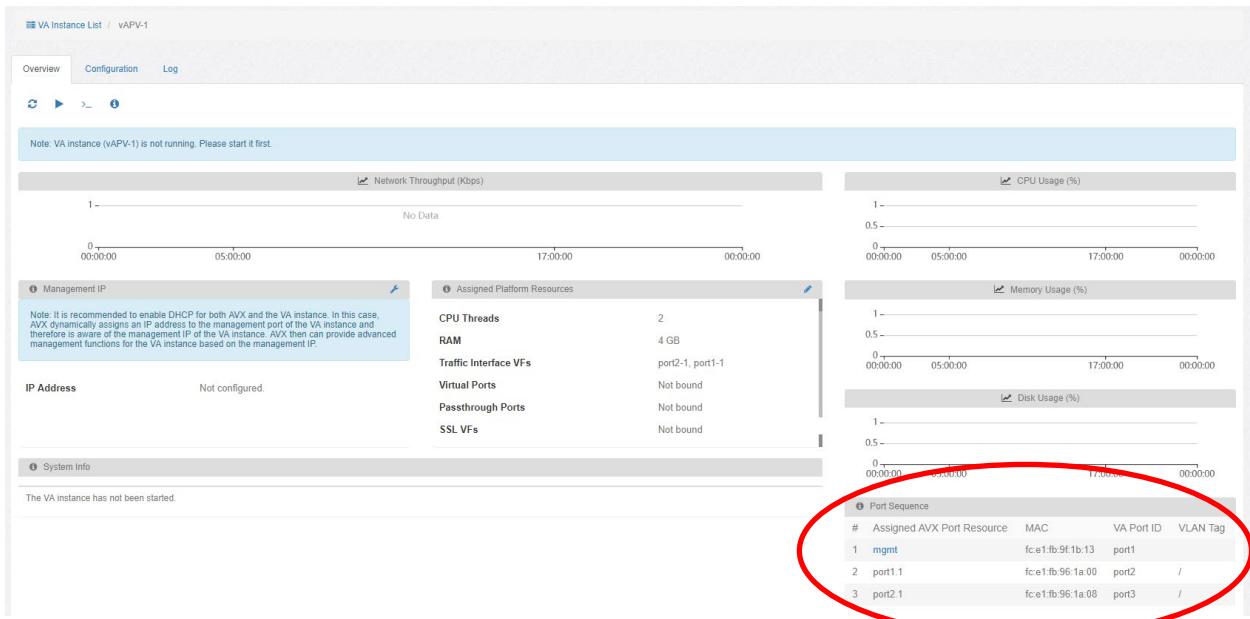

VA Name	vAPV-1
VA Size	small
Domain	1
Image	default
CPU Threads	2
Memory	4G
Traffic Interface VFs	port1_1, port2_1
SSL VFs	N/A

[Previous](#) [Save](#)

### 4. Click on **Save**. Navigate to **VA Management > VA** to view your newly created VA instance.

3	 vAPV-1	vAPV	 ADC	* small	default	Array Networks	 Shutdown	
---	--	------	---	---------	---------	----------------	--	---

## 5. Confirm the correct interfaces by clicking on vAPV-1.

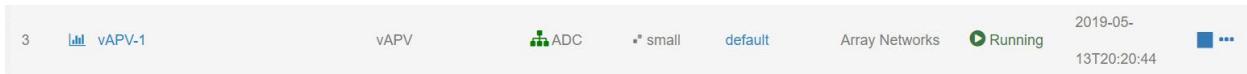

You should see one management port and two SR-IOV traffic ports.

## 5.4. Start the VA Instance

On the AVX WebUI, navigate to **VA Management > VA** to start the VA instance.

1. Locate the VA instance named vAPV-1 and click on the ► symbol under the Action column to start the VA instance.

## 6. Assigning a License to the vAPV VA Instance on AVX1

Please ensure that you have purchased a vAPV License Package Key from Array Networks or an authorized reseller. The vAPV License Package Key will allow you to assign licenses to vAPV VA instances deployed on the AVX appliance.

To assign the license to the vAPV VA instance, follow these steps:

1. On the AVX WebUI, navigate to **Platform > System > System Management**. Scroll down to the vAPV License Status section to view the deployed vAPV VA instance.

#	VA Name	License Type	Software Version	Licensed Features	Action
1	vAPV-1	N/A	Rel.APV.8.6.0.121	N/A	

2. On the far right under the **Action** column, click on the icon.

Assign License

License Type: Package

Assign License

3. Click on the **Assign License** box in the popup.
4. After a few seconds, your vAPV VA instance will have a valid license assigned.

#	VA Name	License Type	Software Version	Licensed Features	Action
1	vAPV-1	Package	Rel.APV.8.6.0.121	WebWall Clustering L4SLB L7SLB Caching SSL tProxy SwCompression LLB GSLB QoS MultiLang DynRoute IPv6	

## 7. Configuring the vAPV VA Instance on AVX1

To configure the vAPV VA instance on AVX1, follow these steps:

1. Login to AVX1 console using default credentials.

```
AVX1>enable (no password)
```

```
AVX1#
```

```
AVX1#config terminal
```

```
AVX1(config)#
```

2. Login to vAPV-1 console using default credentials.

```
AVX1(config)#va console vAPV-1 <Enter> <Enter>
```

```
Array Networks Login (AN): array
```

```
Password: admin
```

```
AN>enable (no password)
```

```
AN#config terminal
```

```
AN(config)#
```

3. Change hostname to APV1.

```
AN(config)#hostname APV1
```

```
APV1(config)#
```

4. Configure IP configuration for management port (port1), ingress (port2), egress (port3) and gateway. (*use your own IPs*)

```
APV1(config)#ip address port1 10.10.152.51 255.255.255.0
```

```
APV1(config)#ip route default 10.10.152.1
```

```
APV1(config)#ip address port2 192.168.1.51 255.255.255.0
```

```
APV1(config)#ip address port3 192.168.2.51 255.255.255.0
```

5. Enable WebUI.

```
APV1(config)#webui on
```

6. Save changes.

```
APV1(config)#write memory
```

You may now access the vAPV-1 VA instance on AVX1 using the WebUI at <https://<IP>:8888>.  
For our example, <https://10.10.152.51:8888>.

## 8. Configuring AVX2

To configure the second AVX appliance, follow these steps:

1. Login to the AVX console using default credentials.

**Login: array**

**Password: admin**

2. Type “enable” and hit the <Enter> key (twice) to enter enable mode. No password is required.

**AN>enable**

**Enable password:**

**AN#**

3. Type “config terminal” to enter config mode.

**AN#config terminal**

**AN(config)#**

4. Change the hostname to AVX2.

**AN(config)#hostname AVX2**

**AVX2(config)#**

5. Configure the IP address and default gateway for the management port.

**AVX2(config)#ip address 10.10.152.172 255.255.255.0 (use your own IP)**

**AVX2(config)#ip route default 10.10.152.1 (use your own gateway IP)**

6. Enable WebUI.

**AVX2(config)#webui on**

7. Save changes.

**AVX2(config)#write memory**

You may now access the AVX2 appliance using the WebUI at <https://<IP>:8888>. For our example, <https://10.10.152.172:8888>.

## 9. Deploying the vAPV VA Instance on AVX2

To deploy the vAPV instance on the AVX appliance:

1. Obtain the image of the vAPV
2. Import the image to the AVX appliance
3. Create a VA instance with the image on the AVX appliance
4. Assign Virtual Traffic ports to the VA instance
5. Start the VA instance

### 9.1. Obtaining the Image of the vAPV

By default, the vAPV is already preloaded as a VA image on the AVX. If not, contact Array Networks to obtain the image. Consult the AVX Application Guide or AVX CLI Handbook for additional information on how to upload and create a VA instance.

### 9.2. Importing the Image to the AVX Appliance

On the AVX WebUI, navigate to **VA Management > VA Image** to upload the vAPV image.

### 9.3. Creating a VA Instance with the Image on the AVX Appliance

On the AVX WebUI, navigate to **VA Management > VA** to create the VA instance using the vAPV image.

1. Create a vAPV VA instance named vAPV-1.

VA Name	vAPV-1
Image	default
VA Size	small
Domain ID	1

Next

2. Configure two traffic ports using the SR-IOV ports. Select the Manual option.

Assign Resources to VA Instance

Auto       Manual

CPU Threads: 1 2 20

Memory: 4G 57G

Unassign Port VFs or SSL VFs

Port VF Assignment							
Port1 VFs	<input checked="" type="checkbox"/>	<input type="checkbox"/>					
Port2 VFs	<input checked="" type="checkbox"/>	<input type="checkbox"/>					
Port3 VFs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Port4 VFs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

SSL VF Assignment							
SSL VFs	<input type="checkbox"/>						

### 3. Confirm the VA Instance Configuration.

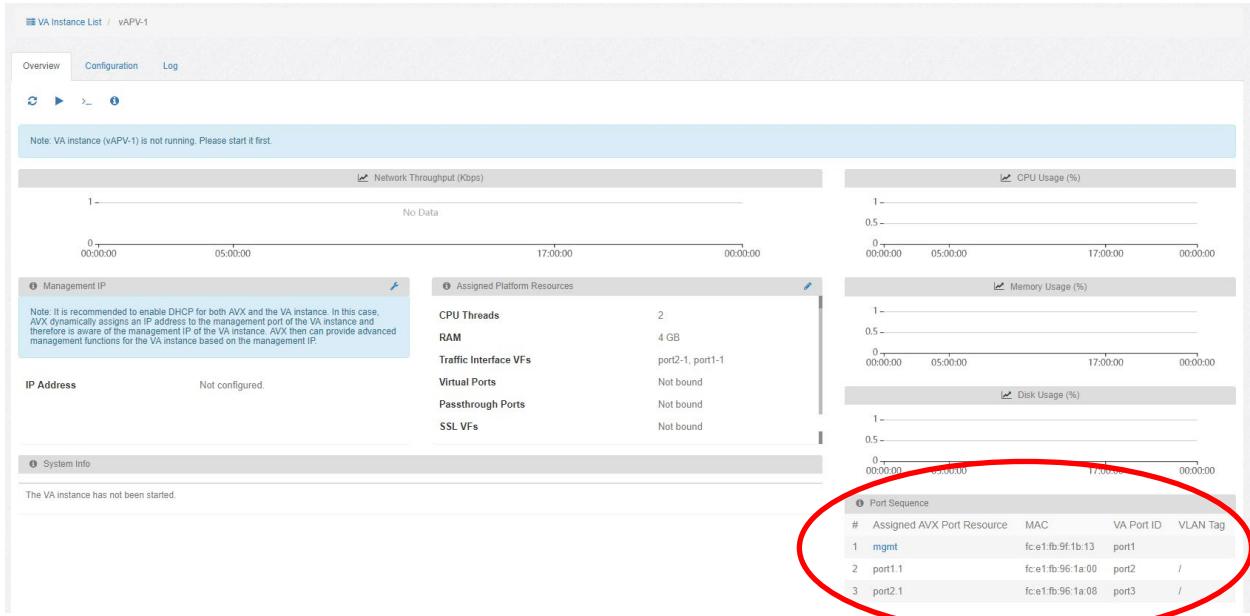

Confirm VA Instance Configuration

VA Name	vAPV-1
VA Size	small
Domain	1
Image	default
CPU Threads	2
Memory	4G
Traffic Interface VFs	port1_1, port2_1
SSL VFs	N/A

### 4. Click **Save**. Navigate to **VA Management > VA** to view your newly created VA instance.

3	vAPV-1	vAPV	ADC	* small	default	Array Networks	Shutdown	
---	--------	------	-----	---------	---------	----------------	----------	--

## 5. Confirm the correct interfaces by clicking on vAPV-1.

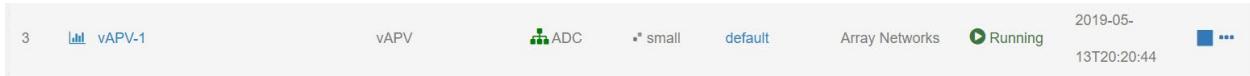

You should see one management port and two SR-IOV traffic ports.

### 9.4. Starting the VA Instance

On the AVX WebUI, navigate to **VA Management > VA** to start the VA instance.

- Locate the VA instance named vAPV-1 and click on the ► symbol under the Action column to start the VA instance.

## 10. Assigning a License to the vAPV VA Instance on AVX2

Please ensure that you have purchased a vAPV License Package Key from Array Networks or an authorized reseller. The vAPV License Package Key will allow you to assign licenses to vAPV VA instances deployed on the AVX appliance.

To assign the license to the vAPV VA instance, follow these steps:

1. On the AVX WebUI, navigate to **Platform > System > System Management**. Scroll down to the vAPV License Status section to view the deployed vAPV VA instance.

vAPV License Status					
#	VA Name	License Type	Software Version	Licensed Features	Action
1	vAPV-1	N/A	Rel.APV.8.6.0.121	N/A	

2. On the far right under the **Action** column, click on the icon.

Assign License

License Type: Package

**Assign License**

3. Click on the **Assign License** box in the popup.
4. After a few seconds, your vAPV VA instance will have a valid license assigned.

vAPV License Status					
#	VA Name	License Type	Software Version	Licensed Features	Action
1	vAPV-1	Package	Rel.APV.8.6.0.121	WebWall Clustering L4SLB L7SLB Caching SSL tProxy SwCompression LLB GSLB QoS MultiLang DynRoute IPv6	

## 11. Configuring the vAPV VA Instance on AVX2

After the vAPV VA instance is up, to complete the initial configuration, follow these steps:

1. Login to AVX2 console using default credentials.

```
AVX2>enable (no password)
```

```
AVX2#
```

```
AVX2#config terminal
```

```
AVX2 (config) #
```

2. Login to vAPV-1 console using default credentials.

```
AVX2 (config) #va console vAPV-1 <Enter> <Enter>
```

```
Array Networks Login (AN): array
```

```
Password: admin
```

```
AN>enable (no password)
```

```
AN#config terminal
```

```
AN(config) #
```

3. Change hostname to APV2.

```
AN(config) #hostname APV2
```

```
APV2 (config) #
```

4. Configure IP configuration for management port (port1), ingress (port2), egress (port3) and gateway. (*use your own IPs*)

```
APV2 (config) #ip address port1 10.10.152.52 255.255.255.0
```

```
APV2 (config) #ip route default 10.10.152.1
```

```
APV2 (config) #ip address port2 192.168.1.52 255.255.255.0
```

```
APV2 (config) #ip address port3 192.168.2.52 255.255.255.0
```

5. Enable WebUI.

```
APV2 (config) #webui on
```

6. Save changes.

```
APV2 (config) #write memory
```

You may now access the vAPV-2 VA instance on AVX2 using the WebUI at <https://<IP>:8888>.  
For our example, <https://10.10.152.52:8888>.

## 12. Configuring SLB on vAPV1 on AVX1

To complete configuring server load balancing (SLB) on vAPV1 on AVX1, follow these steps:

1. Login to vAPV-1 console using default credentials via the AVX1 console.

```
AVX1>enable (no password)

AVX1#
AVX1#config terminal
AVX1(config)#
AVX1(config)#va console vAPV-1
APV1#
APV1#config terminal
APV1(config)#
APV1(config)#slb real http "RS_WEB_1" 192.168.2.53 80 1000 tcp 3 3
APV1(config)#slb real http "RS_WEB_2" 192.168.2.54 80 1000 tcp 3 3
APV1(config)#slb group method "GROUP_HTTP_1" rr
APV1(config)#slb group member "GROUP_HTTP_1" "RS_WEB_1" 1 0
APV1(config)#slb group member "GROUP_HTTP_1" "RS_WEB_2" 1 0
APV1(config)#slb virtual http "VS_HTTP_1" 192.168.1.55 80 arp 0
APV1(config)#slb policy default "VS_HTTP_1" "GROUP_HTTP_1"
APV1(config)#write memory
```

**Note:** Since HA is being deployed, you only need to configure SLB on the master/active vAPV. When the HA synconfig commands are executed, all settings on the master/active vAPV will overwrite the slave/passive vAPV. *Please consult the APV User Guide for more information on how to configure HA.*

## 13. Configuring HA on vAPV1 on AVX1

To complete configuring HA on both vAPV1 on AVX1, follow these steps:

1. Enter the following on APV1.

```
APV1(config)#ha log on  
APV1(config)#ha log level emerg  
APV1(config)#ha unit "1" 192.168.1.51 65521  
APV1(config)#ha unit "2" 192.168.1.52 65521  
APV1(config)#ha group id 5  
APV1(config)#ha group fip 5 192.168.1.55 port2  
APV1(config)#ha group priority "1" 5 100  
APV1(config)#ha group priority "2" 5 50  
APV1(config)#ha group preempt on 5  
APV1(config)#ha group enable 5  
APV1(config)#ha arp interval 30  
APV1(config)#ha synconfig bootup on  
APV1(config)#ha synconfig runtime on  
APV1(config)#ha ssf on  
APV1(config)#ha on  
APV1(config)#write memory
```

**Note:** Since HA is being deployed, you only need to configure HA on the master/active vAPV. When the HA synconfig commands are executed, all settings on the master/active vAPV will overwrite the slave/passive vAPV. *Please consult the APV User Guide for more information on how to configure HA.*

## 14. Configuring HA Syncconfig Peer on vAPV1/AVX1 and vAPV2/AVX2

To complete configuring HA syncconfig peer on both vAPV-1 on AVX1 and vAPV-2 on AVX2, follow these steps:

1. Enter the following on APV1 on AVX1.

```
APV1 (config) #syncconfig peer "vAPV1" 192.168.1.51
```

```
APV1 (config) #syncconfig peer "vAPV2" 192.168.1.52
```

2. Enter the following on APV2 on AVX2.

```
APV2 (config) #syncconfig peer "vAPV1" 192.168.1.51
```

```
APV2 (config) #syncconfig peer "vAPV2" 192.168.1.52
```

3. Enter the following on APV1 on AVX1.

```
APV1 (config) #syncconfig to vAPV2
```

```
APV1(config)#syncconfig to vAPV2
checking version and licenses....

## 15. Verifying the vAPV HA on AVX Configuration

To test and verify that the vAPV HA on AVX configuration is working, you must now simulate a failure of the master or active vAPV VA instance over to the slave or passive vAPV VA instance.

1. Login to the console on both AVX1 and AVX2.

The image shows two separate PuTTY sessions side-by-side. Both sessions are titled '10.10.152.171 - PuTTY' and '10.10.152.172 - PuTTY'. Each session displays a standard Array login prompt:

```
login as: array
array@10.10.152.171's password:
Last login: Mon May 13 20:05:20 2019 from 10.1.231.36
AVX Rel.AVX.2.7.0.48 build on Thu Mar 14 23:51:41 2019
Copyright (c) 2000-2018 Array NetWorks Inc. All rights reserved.

Type "?" for available commands
```

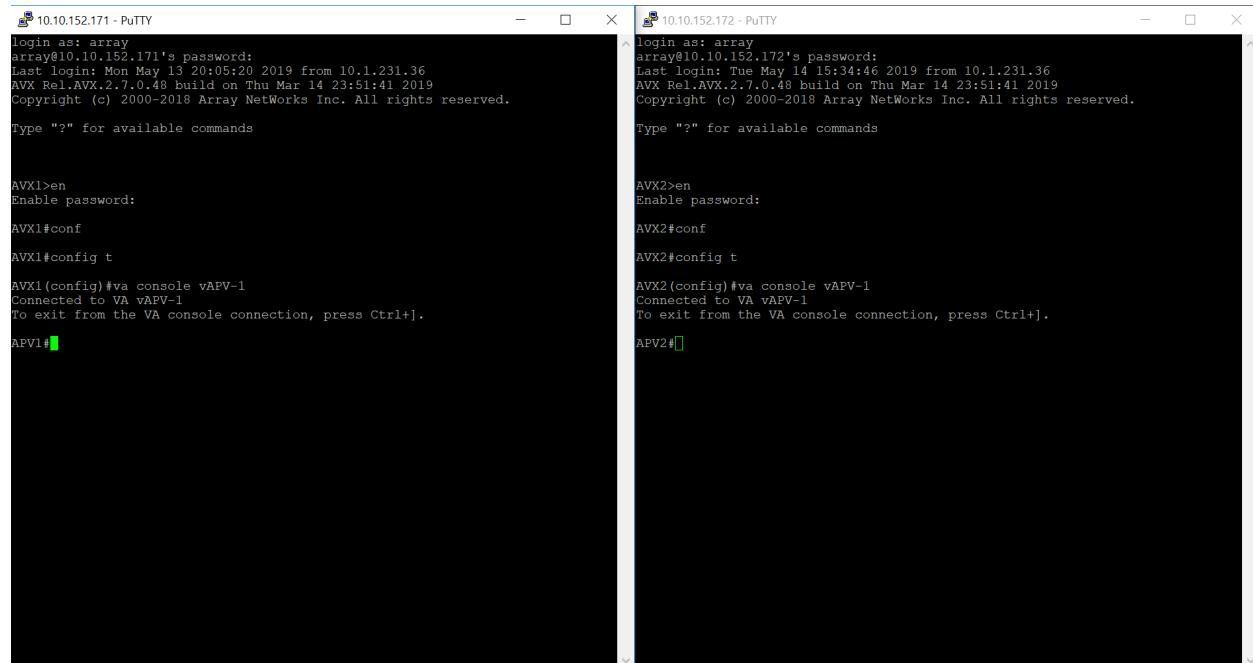

On the left (AVX1), the user has entered their password and is at the command prompt:

```
AVX1>en
Enable password:
AVX1#conf
AVX1#config t
AVX1(config)#
```

On the right (AVX2), the user has entered their password and is at the command prompt:

```
AVX2>en
Enable password:
AVX2#conf
AVX2#config t
AVX2(config)#
```

2. Login to vAPV1 on AVX1 and vAPV2 on AVX2 via console.

The image shows two separate PuTTY sessions side-by-side. Both sessions are titled '10.10.152.171 - PuTTY' and '10.10.152.172 - PuTTY'. Each session displays a standard Array login prompt:

```
login as: array
array@10.10.152.171's password:
Last login: Mon May 13 20:05:20 2019 from 10.1.231.36
AVX Rel.AVX.2.7.0.48 build on Thu Mar 14 23:51:41 2019
Copyright (c) 2000-2018 Array NetWorks Inc. All rights reserved.

Type "?" for available commands
```

On the left (AVX1), the user has entered their password and is at the command prompt. They then enter the command to connect to vAPV1:

```
AVX1>en
Enable password:
AVX1#conf
AVX1#config t
AVX1(config)#va console vAPV-1
Connected to VA vAPV-1
To exit from the VA console connection, press Ctrl+].
APV1#
```

On the right (AVX2), the user has entered their password and is at the command prompt. They then enter the command to connect to vAPV2:

```
AVX2>en
Enable password:
AVX2#conf
AVX2#config t
AVX2(config)#va console vAPV-1
Connected to VA vAPV-1
To exit from the VA console connection, press Ctrl+].
APV2#
```

3. Type "show ha status" to obtain the HA status of the cluster.

```

10.10.152.171 - PuTTY

      5 Active Init
-----  

APV2#
```

Note that the new Master/Active VA instance is APV2 on AVX2 (right-hand side).

5. When the APV1 VA instance on AVX1 (left-hand side) boots back up successfully, it will resume ownership as the Master.

The image shows two PuTTY sessions side-by-side. The left session, titled '10.10.152.171 - PuTTY', represents APV1. The right session, titled '10.10.152.172 - PuTTY', represents APV2. Both sessions show command-line interfaces for Array VA instances.

**APV1 Session (Left):**

```
login as: array

AVX1#show ha st
APV1#show ha status
[HA group status]:
-----
```

Group	ID	Local	Peer [1]
	5	Standby	Active

APV1#

**APV2 Session (Right):**

```
APV2#show ha st
APV2#show ha status
[HA group status]:
-----
```

Group	ID	Local	Peer [1]
	5	Standby	Active

```
APV2#show ha status
[HA group status]:
-----
```

Group	ID	Local	Peer [1]
	5	Standby	Active

```
APV2#show ha status
[HA group status]:
-----
```

Group	ID	Local	Peer [1]
	5	Active	Init

```
APV2#show ha status
[HA group status]:
-----
```

Group	ID	Local	Peer [1]
	5	Standby	Active

APV2#

Red ovals highlight the HA group status tables in both sessions. The first oval covers the APV1 status output, and the second oval covers the APV2 status output. The APV1 status shows Group 5 as Standby/Active. The APV2 status shows Group 5 as Active/Init, then Standby/Active, indicating a transition.

## About Array Networks

Array Networks develops purpose-built systems for deploying virtual app delivery, networking and security functions with guaranteed performance. Headquartered in Silicon Valley, Array is backed by over 250 worldwide employees and is poised to capitalize on explosive growth in the areas of virtualization, cloud and software-centric computing. Proven at over 5000 worldwide customer deployments, Array is recognized by leading analysts, enterprises and service providers, for next-generation technology that delivers agility at scale.
